

Storm Water Management Program

The City of Missouri City has embraced 16 surrounding Municipal Utility Districts, Utility Districts, and Water Control and Improvement Districts to create a joint Storm Water Management Program (SWMP). The SWMP includes Best Management Practices (BMP's) focused on preventing and reducing the discharge of pollutants. Below are helpful tips homeowners can implement to reduce bacteria and pollutants in local waterways.

Pet waste which washes into storm drains pollute our rivers, lakes and drinking water sources. When walking your pet, pick up pet waste and dispose of it properly.

Excess fertilizers and pesticides applied to lawns and gardens wash off and can pollute water bodies. Use pesticides and fertilizers sparingly so excess chemicals do not wash into storm drains.

Avoid pouring household hazardous waste down the drain or toilet, onto the ground, or into storm drains and septic tanks. Manage your household hazardous waste properly to avoid contaminating our water.

Remember:

Only Rain Down The Drain
